## Project Design Phase-II

## **Technology Stack (Architecture & Stack)**

| Date          | 14 October 2022  |  |
|---------------|--|--|
| Team ID       | PNT2022TMID43309   |  |
| Project Name  | pject Name Project - Al-powered Nutrition Analyzer for Fitne |  |
|               | Enthusiasts  |  |
| Maximum Marks | 4 Marks  |  |

## **Technical Architecture:**

The Deliverable shall include the architectural diagram as below and the information as per the table 2

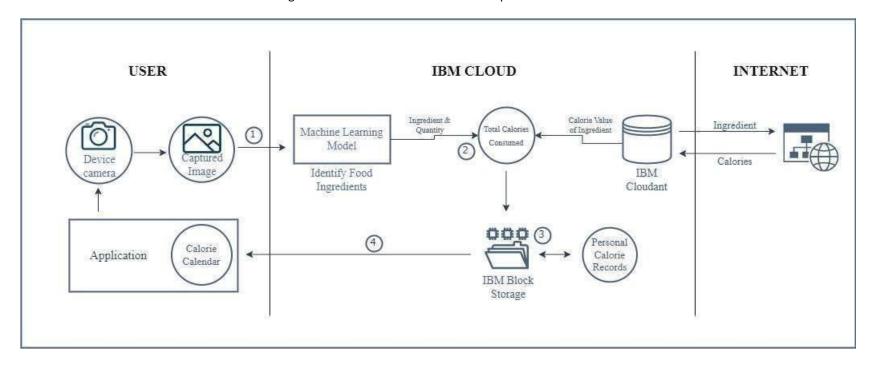

Table-1: Components & Technologies:

| S. No. | Component                       | Description   | Technology                                       |
|--------|---------------------------------|---|--|
| 1.     | User Interface                  | An app that lets users make profiles, upload photos of the components they use in their food, and obtain a personalized nutrition calendar.                                   | HTML, CSS, JavaScript                            |
| 2.     | Image Capture                   | Users are required to take a photo of the ingredient(s) they eat.   | IBM Maximo Image Inspection                      |
| 3.     | Ingredient Detection Model      | The ingredients used must be identified from the captured image.  | Machine Learning & Image Processing using Python |
| 4.     | Calorie Consumption Monitoring  | The software monitors the user's daily calorie intake and alerts them when there is an excess.  | IBM Push Notifications                           |
| 5.     | Database of Ingredients         | Ingredient information and the relevant calories are kept on file.  | MySQL  |
| 6.     | Cloud Database for Back-up      | Here, backup copies of the application's data are kept, and consolidated reports of monthly calendars are also kept.  | IBM Cloudant                                     |
| 7.     | File Storage                    | A file system is used to keep track of the products consumed each day as well as the daily caloric intake. Additionally, a customized calorie calendar is created using this. | IBM Block Storage                                |
| 8.     | Calorie Value Consolidation     | To determine the calorie counts of components that are saved in the database, a web-scraping API is used.   | Beautiful Soup                                   |
| 9.     | Machine Learning Model          | To detect substances, captured photos are analyzed using machine learning algorithms.   | Object Recognition Model to Label Ingredients    |
| 10     | Infrastructure (Server / Cloud) | The program is deployed to the cloud for use.  Configuration of the cloud server:   | Cloud Foundry                                    |

**Table-2: Application Characteristics:** 

| S. No. | Characteristics          | Description  | Technology  |
|--------|--------------------------|--|---|
| 1.     | Open-Source Frameworks   | Google Colab, VS Code, Online Websites   | Python, HTML, CSS, JavaScript                                       |
| 2.     | Security Implementations | Email-based data access authentication and text encryption before file storage   | SMTP, Encryption Algorithms   |
| 3.     | Scalable Architecture    | Applications are updated, bugs are fixed, and new features are added in response to user experience and input.                           | Customer feedback, reviews, andratings                              |
| 4.     | Availability             | Users should always be able to access the cloud-hosted application, and they shouldn't experience any problems like application crashes. |   |
| 5.     | Performance              | The application should be able to process many requests without sacrificing the speed or quality of the results.                         | Testing - Black, White, and Beta Revise application in spiral model |
